

Water-in-fuel warning

Water in your fuel, whether from a dubious supplier or as a result of condensation in the tank, can cause costly damage to your engine. Water separators offer some protection, but if not drained regularly they will only delay the inevitable.

A more systematic safeguard could be the new D-TX Fuel Safe alarm system, which can detect water in the fuel even in minute quantities.

Fitted into the fuel system as close to the

tank as possible, it should give warning of a potential problem long before the water can reach the engine.

Not only that, but you can then drain off the contaminant straight from the unit, so effectively it acts as a preliminary filter.

As well as an audio alarm, the system comes with a dash-mounted plate giving a visual alarm by way of a flashing light.

Powered by either a 12V or 24V supply, D-TX Fuel Safe is suitable for both petrol and diesel fuel systems.
